Let's Start!

Storage Systems to Take Your Data Everywhere!

Learning Outcome:

Build the user interface, supported on the prototype assessment, determining the inputs and outputs required in the design and defining the navigation guidelines, according to the user's needs.

Identifies different hardware components and peripheral devices.

Can Do Statements:

- I can understand written information about solid-state storage and storage in the cloud.
- I can answer questions related with solid-state storage and storage in the cloud.
- I can write a summary about solid-state and storage in the cloud characteristics.

Ask your partner:

- What is your opinion about clouds as a way to store your information?
- What security measures do you take to protect your data?

Let's Explore!

A Radio Broadcast for People Who Love Technology

Instructions: Read the text below.

Lesley: Welcome to "Radio Computer"...

We are going to analyze some written information about solid-state storage and storage in the cloud by the systems engineer Thomas Smith. According to him, solid-state storage is reflected on most portable devices that we use nowadays. Flash drives, memory sticks or portable devices with built-in memory are some examples of solid-state storage. These kinds of devices have been evolving to give us the space for storage that we need. On the other hand, storage in the cloud has been becoming more popular. It is easy to find internet connections wherever we go and our files aren't limited to only one device as they will be part of a remote server. Now, we are going to answer some questions from the listeners.

The first question is: "What is a flash memory made of?" Well, a flash memory is made of a grid of cells. Each cell contains two transistors, one of them is called control gate, and this transistor is in charge of controlling the flow of charge. The other transistor is called floating gate, it is in charge of registering all the information in the device. The second question is: "How are clouds composed and what are they used for?" The cloud service is provided through a network. They aren't designed only to back up information, the idea is for you to have access to your files and share them anywhere you are.

To conclude this show, I will read a summary that one of the listeners wrote... Solid-state and storage in the cloud have been helping users to back up and maintain information accessible. Clouds have been changing the way in which we share information, and USBs allow us to carry files without the necessity of an internet connection. They're a good complement.

Let's Practice!

Do you understand these two concepts?

Instructions: Read the statements. Select all the correct answers.

1. The engineer Thomas Smith has been explaining that...
 - a. a solid-state storage exists on most portable devices that people use today.
 - b. flash drives, memory sticks or portable devices with built-in memory are examples of solid-state storage.
 - c. flash drives, CDs or portable devices with built-in memory are examples of solid-state storage.
 - d. solid-state storage devices give us the space for storage that we need.
 - e. solid-state storage devices fill the space for storage in the computer.
2. On the other hand, Thomas Smith has been saying that...
 - a. only young people can use the storage in the cloud.
 - b. most of people use the storage in the cloud nowadays.
 - c. to use the storage in the cloud it's important to have a good Internet connection.
 - d. files will be limited to only one device.
 - e. files won't be limited to only one device.

Let's Practice!

Let's answer the following questions!

Instructions: Match column A with column B.

COLUMN A

1. What is a flash memory made of?
2. What is the storage in the cloud used for?
3. What are the elements contained in cells?
4. How is storage in the clouds composed?
5. What is the function of these transistors?

COLUMN B

- a. These objects are composed by two transistors: control gate and floating gate.
- b. A flash memory is made of a grid of cells.
- c. It isn't designed only to back up information. People can also have access to their files and share them anywhere they are.
- d. The cloud service is provided through a network.
- e. The flow of charge is controlled by the control gate, and the register of the all information is done by the floating drive.

Extension Activity

It's time to remember some solid-state storage concepts!

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look for information about solid-state storage and storage in the cloud.
- Take notes about the most important information in both concepts.
- Make a report where you explain each storage and what could be the best option for people today.
- Share your report with your partners.

Self-Assessment

Yes

No

- I search information about solid-state storage and storage in the cloud.
- I make a report that explains each storage and the best option to use today.
- I share my work with the class.

☐ ☐☐ ☐☐ ☐

Target Words

- **memory stick** (noun): removable small-sized memory for portable devices
e.g. Memory sticks or portable devices with built-in memory are some examples of solid-state storage.
- **built-in** (adjective): included features from factory
e.g. Portable devices with built-in memory are some examples of solid-state storage.
- **flash memory** (noun): non-volatile storage device used to save and transport files
e.g. A flash memory is made of a grid of cells.
- **transistor** (noun): electronic device that reacts to signals
e.g. This transistor is in charge of controlling the flow of charge.
- **control gate** (noun): transistor that controls the flow of charge
e.g. Each cell contains two transistors, one of them is called control gate.
- **floating gate** (noun): where all data is recorded
e.g. The other transistor is called floating gate, it is in charge of registering all the information in the device.

Learning Points

Present Perfect Continuous- Affirmative Form

You use **present perfect continuous** to talk about actions that started in the past and continue to happen in the present in a progressive way.

Whenever we want to express that we started an action, and that we are still doing it, we can use **present perfect continuous**. In order to formulate sentences, we are always going to use the verb in past participle **been** after *have* or *has*.

Let's review the grammatical structure:

Subject + **have/has + been** + (verb + **ing**) + complement

Example:

- Clouds **have been giving** users big amount of space for storage.
- My flash drive **has been showing** some error messages.

Examples

- *These kind of devices have been evolving to give us the space for storage that we need.*
- *Storage in the cloud has been becoming more popular.*
- *Solid-state and storage in the cloud have been helping users to back up and maintain information accessible.*

Learning Points

Simple Present Passive- (All Forms)

You use **simple present passive** in affirmative, negative and questions to provide more importance to the object and the action in a sentence rather than the subject.

When we use **passive voice**, we focus on the object of the action rather than on the subject. The subject can be mentioned or omitted and the sentence should keep the same intention. If you want to mention the subject, you use **by** after the verb.

Let's review the grammatical structure in affirmative, negative and interrogative sentences.

Affirmative:

Object of the sentence + **verb to be** + **verb in past participle** + Complement

Example: *Flash drives **are used** (by people) to transport data easily.*

Negative:

Object of the sentence + (**verb to be** + **not**) + **verb in past participle** + Complement

Example:

- *Clouds **aren't used** (by people) as frequently as flash drives.*

Questions:

Verb to be + object of the sentence + **verb in past participle** + Complement + ?

Example:

- ***Are** clouds **designed** to upload any kind of file?*

As you can see in the examples, the object is more important than the subject.

Examples

- *Solid-state storage is reflected on most portable devices that we use nowadays.*
- *Our files aren't limited to only one device as they will be part of a remote server.*
- *How are clouds composed and what are they used for?*
